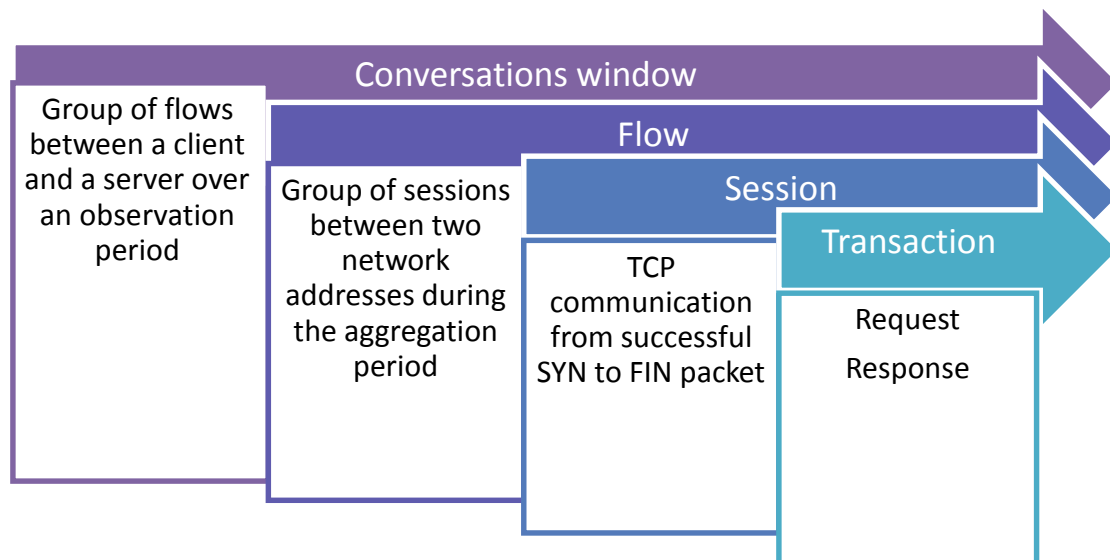

Figure 1: Data stream encapsulated types

- **Transaction** – represents an interaction between a client and a server. It is a two-way communication: the client sends a request to the server, and the server processes the request and sends a response back to the client. We handle the following types of transactions:
 - An HTTP transaction consists of sending one request and response message between a client and a server
 - A DNS transaction is equivalent to one session with two packets, one for the request and another for the response with the same transaction ID.
 - An SSL transaction is the aggregation of all App-data packets sent from a client to a server and vice versa after a successful handshake step and until the session ends.
- **Session** – A unique 4-tuple consisting of source and destination IP addresses and port numbers.
 - A TCP session begins with a successful handshake, and ends with one of the following: Timeout, packet with the RST or FIN flag from any of the devices.
 - A UDP session consists of all packets sent from a client to a server and from a server to a client until a defined communication idle time is reached.
- **Flow** – A group of sessions between two network addresses (IP pair) during the aggregation period. The aggregation period can be specified by an algorithm as the accurate period of time from the start of the first session in the flow, until the maximum idle time between two sessions. A new flow starts iff the time between the end of a session (the last packet) and the start of a new session (first packet) is more than the defined idle time. The new session is then part of the new flow.
- **Conversation** – A group of flows between a client and a server over an observation period. A conversation can be defined between two network addresses (IP pair) or a group of network resources, (e.g., between two autonomous system).

Full features list

| # | Feature | Observation level | | Description |
|----|----------------------------------|---------------------|--------------------|--|
| 1 | cw_count_asn | Conversation Window | | Number of autonomus sytems participated in communication |
| 2 | cw_count_country | Conversation Window | | Number of countries participated in communication |
| 3 | cw_count_flows | Conversation Window | | Number of flows in conversation window |
| 4 | cw_dns_bad_additional_avg | Conversation Window | Average | Number of additional fields in bad DNS response |
| 5 | cw_dns_bad_additional_entropy | Conversation Window | Entropy | Number of additional fields in bad DNS response |
| 6 | cw_dns_bad_additional_firstQ | Conversation Window | First quartile | Number of additional fields in bad DNS response |
| 7 | cw_dns_bad_additional_max | Conversation Window | Maximum | Number of additional fields in bad DNS response |
| 8 | cw_dns_bad_additional_median | Conversation Window | Median | Number of additional fields in bad DNS response |
| 9 | cw_dns_bad_additional_min | Conversation Window | Minimum | Number of additional fields in bad DNS response |
| 10 | cw_dns_bad_additional_stdev | Conversation Window | Standard deviation | Number of additional fields in bad DNS response |
| 11 | cw_dns_bad_additional_sum | Conversation Window | Sum | Number of additional fields in bad DNS response |
| 12 | cw_dns_bad_additional_thirdQ | Conversation Window | Third quartile | Number of additional fields in bad DNS response |
| 13 | cw_dns_bad_additional_var | Conversation Window | Variance | Number of additional fields in bad DNS response |
| 14 | cw_dns_bad_answers_avg | Conversation Window | Average | Number of answer fields in bad DNS response |
| 15 | cw_dns_bad_answers_entropy | Conversation Window | Entropy | Number of answer fields in bad DNS response |
| 16 | cw_dns_bad_answers_firstQ | Conversation Window | First quartile | Number of answer fields in bad DNS response |
